TI   Production of the phytoalexin glyceollin I by soybean
roots in response to
     symbiotic and pathogenic infection
AU   Schmidt, Petra E.; Parniske, M.; Werner, D
CS   Fachbereich Biol., Philipps-Univ., Marburg, Germany
SO   Bot. Acta (1992), 105(1), 18-25
     CODEN: BOACEJ; ISSN: 0932-8629
DT   Journal
LA   English
AB   The amt. of the phytoalexin glyceollin I (I) in root
exudate and root
     ***hairs***  of individual seedlings of Glycine max was
```

analyzed using a
RIA. Bradyrhizobium japonicum 110spc4, which is able to form N fixing
nodules with this plant, caused an increase of Itoreq 50-fold in I levels
in root exudate relative to uninfected control seedlings. Max. I levels
were reached within 10 h of incubation. Elevated I levels were also obsd.
after incubation of soybean roots in sterile bacterial supernatant, a
suspension of autoclaved bacteria or the supernatant from broken cells of
B. japonicum. Increased I prodn. is not due to the process of active root
hair penetration by the microsymbiont since living bacterial cells
are not necessary for the induction. The obsd. I prodn. in response to B.
japonicum is several times lower than that after pathogenic infection.
Infection with zoospores of the phytopathogenic oomycete, Phytophthora
megasperma f. sp. glycinea race 1, leads within 20 h to an accumulation of
7 nmol I seedling in the root exudate of the compatible cultivar Kenwood
and 48 nmol -I seedlings in that of the incompatible cultivar Maple Arrow.
Apparently, phytoalexins are implicated in detn. of compatibility in
pathogenic interactions. Crude cell exts. of different symbiotic bacteria
(B. japonicum 110spc4, R. meliloti 2011, R. leguminosarum PRE 8,
Sinorhizobium fredii HH 103) were found to induce different amts. of I in
the root exudate. The obsd. I levels could not be correlated with the
ability of these rhizobial strains to nodulate soybean.
Inhibition of flavonoid and phytoalexin synthesis by
(R)-(1-amino-2-phenylethyl) ***phosphonic*** acid (APEP), a specific
inhibitor of the phenylalanine-ammonia-lyase (PAL), during the
first 20 h of the symbiotic interaction dramatically decreased the no. of
nodules formed in root regions that had been in contact with the
inhibitor . This effect was obsd. at concns. that
inhibited neither bacterial nor plant growth. The implications of
these findings for the process of nodule initiation are discussed.

TI Amelioration of cisplatin-induced ototoxicity by fosfomycin
AU Schweitzer, Vanessa G.; Dolan, David F.; Davidson Thomas, Abrams, Gerald
E.; Snyder, Ronald
CS Dep. Otolaryngol. Head Neck Surg., Henry Ford Hosp., Detroit, MI, 48202, USA
SO Laryngoscope (1986), 96(9, pt. 1), 948-58
CODEN: LARYA8; ISSN: 0023-852X
DT Journal
LA English
AB The continued chemotherapeutic application of cisplatin [15663-27-1]
necessitates redn. of its dose-limiting toxicity without decreasing its
tumoricidal effect. This research project evaluated the efficacy of
fosfomycin [23155-02-4], a ***phosphonic*** acid antibiotic, in
decreasing or ameliorating the ototoxicity (high-frequency sensorineural
hearing loss) and nephrotoxicity (renal tubular necrosis and interstitial
nephritis) of cisplatin. The efficacy of fosfomycin in blocking
Pt-induced toxicity in the guinea pig was evaluated histol. and
functionally using cyocochleog. and light microscopy of the organ of Corti
and the auditory brain stem evoked response (ABR), and light microscopy of
renal corticomedullary tissues, small bowel, liver, lung, and peripheral
nerve. The results demonstrate that fosfomycin ameliorates the acute
renal tubular necrosis and interstitial nephritis and markedly
inhibits the elevation of ABR thresholds and simultaneous outer
hair cell loss that can result from cisplatin administration.
Fosfomycin should be considered a potential antidote for the dose-limiting
ototoxicity and nephrotoxicity of cisplatin chemotherapy.

AB Novel thienopyran compds. I-III [X H or electron-withdrawing group; Y =
spiro fusion with an (un)substituted, unsatd. or monounsatd., alicyclic or
heterocyclic ring; Z = H, OH, or alkoxy], compds. having

6 analogous
structures based on IV and V [A, D = 2-oxopyrrolidino, 2,5-dihydro-3,4-dimethyl-1-oxo-2-thienyl, and analogs], and addnl. related
compds. are disclosed. The compds. are potassium channel activators, and
are particularly useful as hair growth modulators. The compds. are also
useful as anti-hypertensive agents and for asthma treatment. In
particular, one group of the compds. has a heterocyclic ring
spiro-connected at the 7-position of the thienopyran ring structure. For
instance, the thienopyran deriv. VI (prepn. given) underwent a sequence
of: (1) bromination in aq. DMSO to give a trans bromohydrin (86%); (2)
redn. of the bromide with Bu3SnH to give the alc. (90%); (3) oxidn. of the
alc. to a ketone with PCC (79%), (4) conversion of the ketone to the
thione analog with Lawesson's reagent (100%), and (5) Diels-Alder reaction
of the thione with 2,3-dimethyl-1,3-butadiene (69%), to give title compd.
VII. In a cell growth potentiation assay for prediction of hair growth
stimulation, VII at 100 .mu.M showed an activity of 271% vs. minoxidil.

PRAI JP 1992-170911 19920629
WO 1993-JP868 19930625

AB A compn. for treating keratinous fibers comprises: (a) a first agent
contg. a metal ion, (b) a second agent contg. an org. or inorg. compd.
which is capable or readily permeating into the keratinous fibers and can
form water-insol. or sparingly sol. complex together with the metal ion of
component (a), and an org. compd. which cannot readily permeate into the
keratinous fibers, and which reacts with the metal ion of component (a) to
form a water-sol. complex. When the compn. is used for treating
keratinous fibers, it allows water-insol. or sparingly sol. complex
products to deposit inside the keratinous fibers while ***preventing***
them from depositing on the surface of the keratinous fibers. Because of
this mechanism, the present compn. is capable of imparting sufficient
firmness and elasticity to keratinous fibers without inducing any
objectionable rough or frictional feel to the touch of the hair. For
example, a first agent contained hydroxyethyl cellulose 1.3, CaCl2 1.5%,
and water balance and a second agent contained hydroxyethyl cellulose 1.3,
oxalic acid 2.0, 1-hydroxyethylidene-1,1-disulfonic acid 1.0%, arginine
q.s., and water balance.

softening the hair to be shaved so as to reduce the cutting force
required to cut it. The novel method comprises carrying out the following
sequential steps: (a) contacting an area of hair to be shaved with a
reducing agent that breaks disulfide linkages in hair; (b) contacting the
area of hair treated in step (a) with a humectant and allowing it to dry
or partially dry; (c) contacting the area treated in step (b) with water
to hydrate the hair; and (d) shaving the hydrated hair of step (c).

The compsn. contains (A) 1-20 wt.% of an anionic surfactant(s) of formula
R1-O-(CH2CH2O)n-SO3M (I), (B) 0.1-10 wt.% of an alkanol amide(s) of
formula (II), (C) 0.1-2.0 wt.% of an amido amine type amphoteric
surfactant(s) of formula (III), (D) 0.001-1 wt.% of diphosphonic acid(s)
of formula (IV), (E) 0.01-3 wt.% of l- and or dl-menthol and (F) 0.01-1
wt.% of an organic acid(s). R1 is 8-20 C alkyl or alkenyl; n is 0-5; and M
is NH4 or cation derived from an alkanolamine. R2 is 7-21C alkyl or
alkenyl. R3 and R5 are 7-19C alkyl or alkenyl; R4 and R6 are -CH2COOM1 or
-CH2CH2COOM1; R7 is H, -CH2COOM1 or -CH2CH2COOM1; and M1 is H, alkali
metal or cation derived from an alkanolamine. M2 - M5 are H or alkali
metal.
USE - The compsn. does not cause time-lapse colouration.
